Four Channel Analog Input
Complete Sensor to RS-485 or RS-232C Interface
ASCII Format Command/Response Protocol
500 V RMS Analog Input Isolation
15-Bit Measurement Resolution
Continuous Self-Calibration; No Adjustments of any Kind
Programmable Digital Filter
Requires 10 V to 30 Vdc Unregulated Supply
Transient Suppression on RS-485 Communications Lines
Screw Terminal Plug Connectors Supplied

The D5000 four channel sensor to computer modules are a family of complete solutions designed for data acquisition systems based on personal computers and other processor-based equipment with standard serial I/O ports.

The modules convert four analog input signals to engineering units and transmit in ASCII format to any host with standard RS-485 or RS-232C ports. These modules can measure temperature, voltage and current. The modules provide direct connection to a wide variety of sensors and perform all signal conditioning, scaling, linearization and conversion to engineering units.

The modules contain no pots or switches to be set. Features such as address, baud rate, parity, echo, etc. are selectable using simple commands over the communications port—without requiring access to the module.

The selections are stored in nonvolatile EEPROM which maintains data even after power is removed. The key to the D5000 series is that the modules are easy to use. You do not need engineering experience in complicated data acquisition hardware. With the D5000 series modules, anyone familiar with a personal computer can construct a data acquisition system.
This modular approach to data acquisition is very flexible, easy to use and cost effective. The modules can be mixed and matched to fit your application. They can be placed remote from the host and from each other. You can string up to 30 modules on one set of wires by using RS-485 with repeaters.

The D5000 Series is completely hardware and software compatible with the D1000, D2000, D3000 and D4000 series and may be mixed in any combination.

All modules are supplied with screw-terminal plug connectors and captive mounting hardware. The connectors allow system expansion, reconfiguration or repair without disturbing field wiring.

**THEORY OF OPERATION**

D5000 modules are complete four-channel data acquisition systems. Each unit contains analog signal conditioning circuits optimized for a specific input type. The amplified sensor signals are converted to digital data with a microprocessor-controlled integrating A/D converter. Offset and gain errors in the analog circuitry are continuously monitored and corrected using microprocessor techniques. The D5000 converts the digital signal data into engineering units using look-up tables. The resultant data is stored in ASCII format in a memory buffer. The modules continuously convert data at the rate of 8 conversions per second and store the latest result in the buffer.

The host computer may request data by sending simple ASCII commands to the module. The D5000 will instantly respond by communicating the ASCII buffer data back to the host.

**USER OPTIONS**

The D5000 offers a variety of user-selectable options including choice of address, baud rate, parity, echo, etc. All options are selectable using simple commands over the communications port. All options are stored in a nonvolatile EEPROM which maintains data even after power is removed.

**DIGITAL FILTER**

The D5000 options include a unique programmable single pole digital filter. The filter is used to smooth analog data in noisy environments. Separate time constants may be specified for small and large signal changes. Typically, a large time constant is specified for small signal changes to filter out noise and provide stable output readings. A smaller time constant may be chosen for large signal changes to provide fast response to such changes.

**COMMUNICATIONS**

The D5000 are designed to be easy to interface to all popular computers and terminals. All communications to and from the module are performed with printable ASCII characters. This allows the information to be processed with string functions common to most high-level languages such as BASIC. For computers that support standard ports such as RS-232C, no special machine language software drivers are necessary for operation.

RS-232C is not designed to be used as a multiparty system; however, the module can be daisy-chained to allow many modules to be connected to a single communications port.

In this network, any characters transmitted by the host are received by each module in the chain and passed on to the next module until the information is echoed back to the host. If a module is correctly addressed and receives a valid command, it transmits a response on the daisy chain network. The response will be rippled through any other modules in the chain until it reaches the host.

RS-485 was developed for multidropped systems that can communicate at high data rates over long distances. For systems requiring many modules, high speed or long distances, RS-485 is recommended.

**COMMAND SET**

The D5000 Series uses a simple command/response protocol for communication. A module must be interrogated by the host to obtain data. A module can never initiate a command sequence. A typical command/response sequence could look like this:

Command: $1RD
Response: *+00075.00

RS-232 is not designed to be used as a multiparty system; however, the module can be daisy-chained to allow many modules to be connected to a single communications port.
For greater data security, options are available to echo transmitted commands and to send and receive checksums.

A command is initiated with a command prompt, which may be a dollar sign ($) or a pound sign (#). Following the prompt, a single address character must be transmitted. Each module on a communications bus must be set up with a unique address. The command is directed in this case to module address ‘1’. The address is followed by a two-character command, which in this case is RD for Read Data. The command is terminated with a carriage return. The table below shows the D5000 commands. For each case, a sample command and response is shown. Notice that some commands only respond with an * acknowledgment.

**UTILITY SOFTWARE**
The utility software CD contains Windows setup software that makes the D5000 series easier to learn and use. A menu-driven setup program is provided to simplify configuration of all user-selectable options such as address, baud rate and parity. Context-sensitive help is available during configuration for each selectable parameter. The utility software also contains programming examples written in high level languages such as Visual Basic and C. The examples are easily configured for COM1: or COM:2: ports are provided in ASCII text format. One copy of the utility software CD is included with each D5000 module.

**D5000 Scaling**
Each D5000 can output data in easy-to-understand engineering units that may be instantly read and interpreted, without software conversion, by a host computer. Using simple ASCII commands, the voltage or current input range of a D5000 module can be rescaled to represent desired engineering units such as degrees or psi.

For example, an application requires the displayed output values from a D5251 4-20 mA current input module to be rescaled to 0 to 100%.

**D5000 Mechanicals and Dimensions**
- **Case:** ABS with captive hardware
- **Connector:** Screw terminal barrier plug (supplied)

**SPECIFICATIONS**

**ANALOG**
- **Channels:** Four analog input
- **Maximum CMV:** Input to output at 60 Hz: 500 V rms
- **Leakage:** Input to output at 115 V rms, 60 Hz: <2µA rms
- **Resolution:** 15-bit measurement
- **Conversion Speed:** 8 conversions per second
- **Common Mode Rejection:** 100 dB at 50/60 Hz
- **Calibration:** Autozero, no adjustment pots
DIGITAL
Microcomputer: 8-bit CMOS
Filtering: Small and large signal digital filtering with user selectable time constants

COMMUNICATIONS
Baud Rates: 300, 600, 1200, 2400, 4800, 9600, 19,200, 38,400, 57,600, 11,5200
Data Format: NRZ asynchronous; 1 start bit, 7 data bits, 1 parity bit and 1 stop bit
Parity: Odd, even, none
Address: User selectable address
Protocol: ASCII format

Multidrop Modules:
Up to 30 per host serial port
Communications: Distance up to 1219 m (4000') (RS-485)
Transient Suppression: On RS-485 communication lines
Communications Error: Checking via checksum
Communications Setups: Stored in EEPROM

POWER REQUIREMENTS
Unregulated: 10 V to 30 Vdc, 0.75W max. Protected against power supply reversals.

ENVIRONMENTAL
Temperature Range:
Operating: -25 to 70°C
Storage: -25 to 85°C
Relative Humidity:
0 to 95% non-condensing

D5100 VOLTAGE INPUTS
Input Ranges: ±100 mV, ±1 V, ±5 V, ±10 V, ±100 Vdc
Resolution: 0.01% of FS (4 digits)
Accuracy: ±0.02% of FS max
Zero Drift: ±1 count maximum
(Span Tempco: ±50ppm/°C maximum
Input Burnout Protection:
To 250 Vac
Input Impedance:
≤ ±1 V input = 100 MΩ min
≥ ±5 V input = 1 MΩ min

D5200 CURRENT INPUT
Current: 4-20 mA
Resolution: 0.04% of FS
Accuracy: 0.04% of FS
Zero Drift: ±1 count maximum
(Span Tempco: ±50ppm/°C maximum
Voltage Drop: ±1.0V max

D5300 THERMOCOUPLE INPUTS
Thermocouple Types:
J, K, T, E (factory set)

D5450 THERMISTOR INPUTS
Thermistor Types:
2252Ω Thermistor
